REPORT ON VITAL STATISTICS FOR THE YEAR 1954

This Report has been prepared by the Central Statistics Office for the Minister for Health in accordance with the provisions of Section 2 of the Vital Statistics and Births, Deaths and Marriages Registration Act, 1952. It follows closely the form of the Reports of the Ard-Chlaraitheoir for earlier years.

The statistics in this Report relate to the area in Ireland exclusive of the Six Counties.

In this Report births have been assigned to the district containing the normal residence of the parents, and deaths to the district containing the normal residence of the deceased. The number of births shown for each of the years 1943 to 1954 is exclusive of late registrations, and the number of deaths for each of the years 1940 to 1954 is exclusive of non-residents.

The important statistics contained in this Report have already been published, and the Report consists mainly of a break-down and analysis of these statistics.

GENERAL SUMMARY

Marriages - There were 15,831 marriages registered during the year 1954 compared with 15,888 in 1953. The marriage rate per 1,000 population was 5.4. This rate has been virtually stable since 1948. It is, however, exceptionally low when comparison is made with other countries. The average annual marriage rate in the ten years 1944-53 was 5.5 per 1,000 population.

Births - The number of births registered during 1954 was 62,534 and the birth rate was 21.3 per 1,000 population compared with 21.2 per 1,000 population in 1953. The average annual rate for the ten years 1944-53 was 22.0 per 1,000 population.

The number of illegitimate births registered in 1954 was 1,310 or 2.1 per cent of all births. This proportion is considerably lower than that of 3.1 per cent for the ten years 1944-53.

Deaths - The number of deaths registered during 1954 was 35,535 and the death rate was 12.1 per 1,000 population. The average annual rate for the period 1944-53 was 13.4 per 1,000 population.

Of the deaths registered in 1954, 29.9 per cent were stated to be due to heart disease, 12.9 per cent to malignant neoplasms, 9.8 per cent to vascular lesions affecting the central nervous system and 2.8 per cent to tuberculosis (all forms).

The number of deaths from tuberculosis of all forms was 1,005 and the rate was 0.34 per 1,000 population. This is the lowest rate recorded up to 1954. There has been a considerable decline in the death rate from tuberculosis since 1947, when it was 1.24 per 1,000 population.

There were 4,423 deaths from malignant neoplasms and neoplasms of lymphatic and haematopoietic tissues (excluding Hodgkin's disease and leukaemia and aleukaemia). This total is comparable with that for "cancer" in the 1949 and earlier Reports. The rate in 1954 was 1.51 per 1,000 population compared with 1.47 in 1953.

During 1954 the deaths of 2,364 infants under 1 year were registered, equivalent to a rate of 38 per 1,000 live births. This is the lowest rate recorded.

The total number of deaths from accidents and other external causes in 1954 was 970 of which road vehicle accidents accounted for 260.

Marriage, birth and death rates per 1,000 population for the years 1938 to 1954 are illustrated in Diagram 1.

Issue of Authority for Registration - Births and deaths which have not been registered within 1 year of their occurrence can only be registered on the authority of the Ard-Chlaraitheoir. The number of births registered on the authority of the Ard-Chlaraitheoir in 1954 was 1,290 and the number of deaths registered was 207. Throughout the tables in this Report these births and deaths have been excluded.

Population - The estimated population at mid-1954 was 2,933,000.

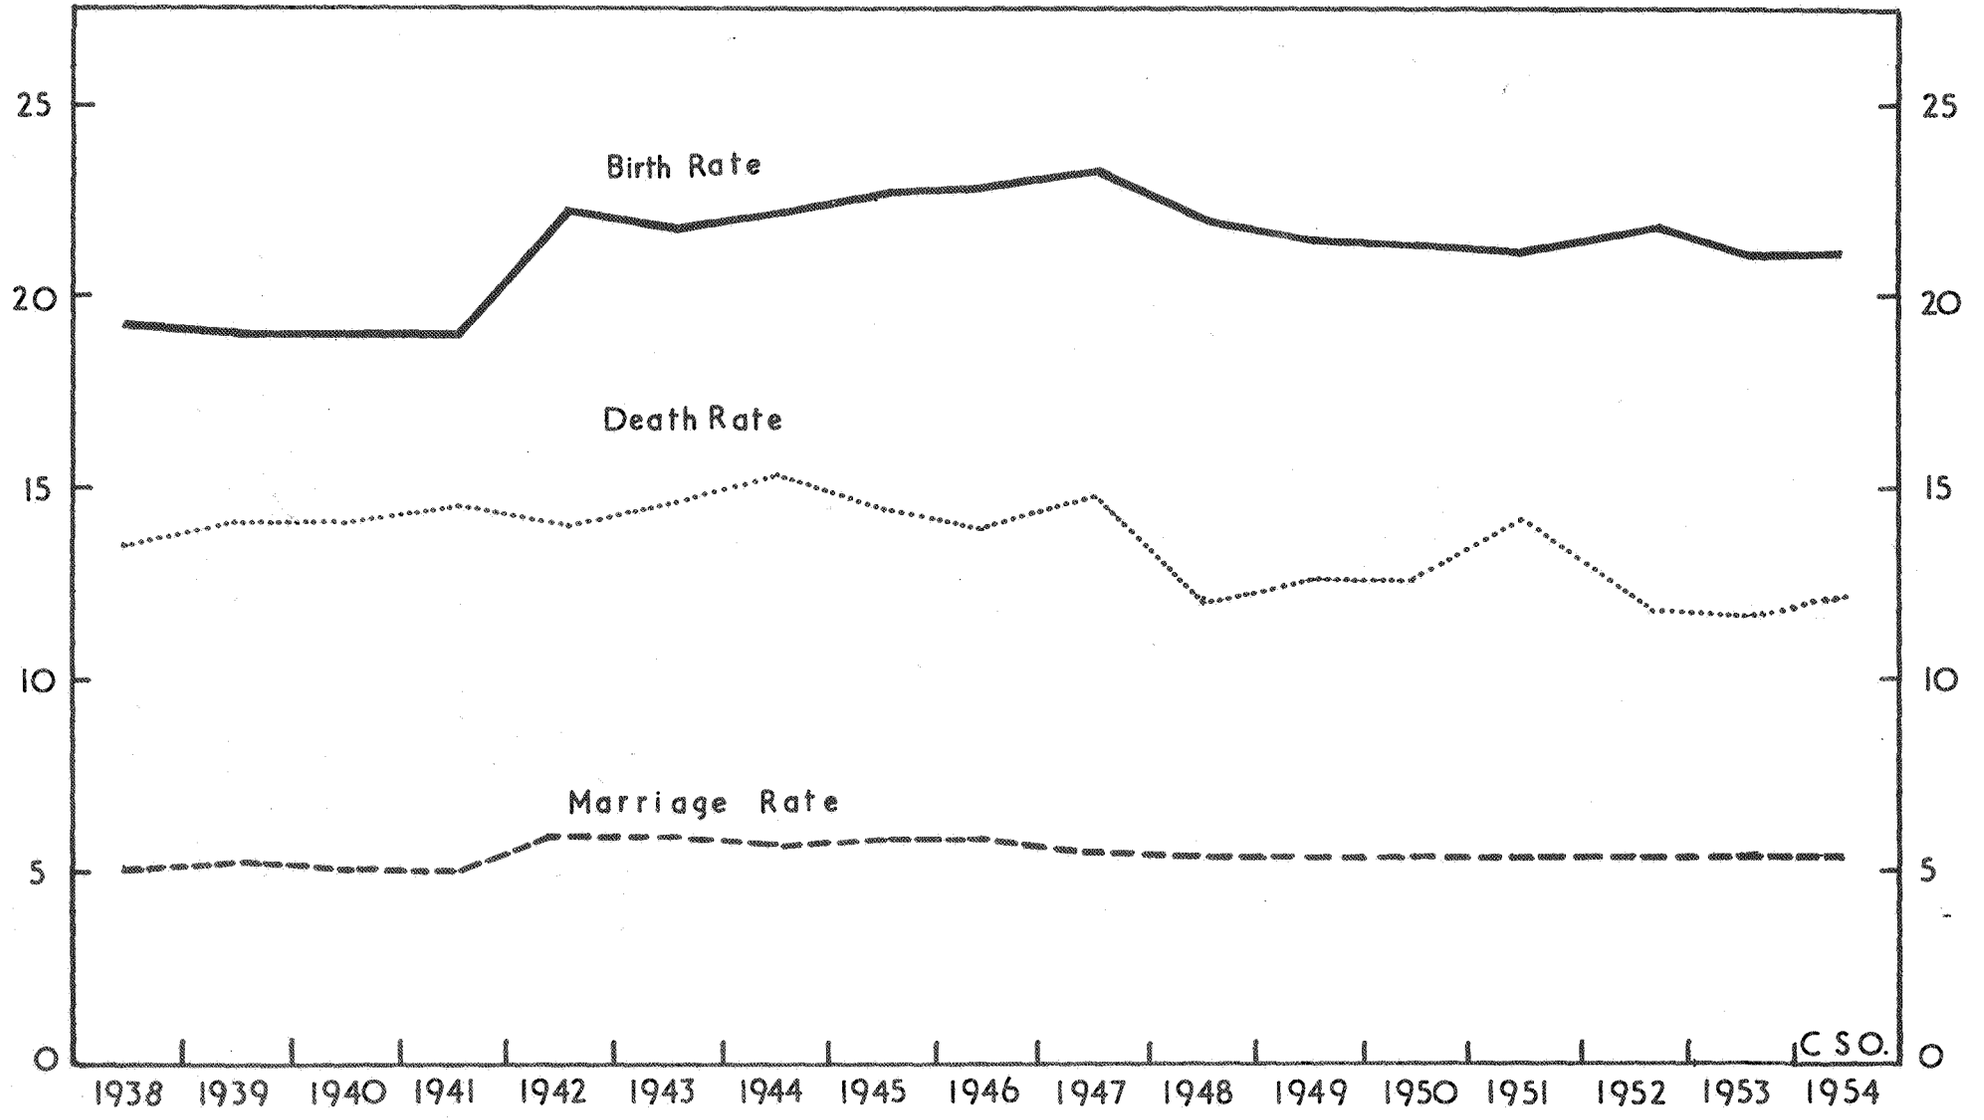
BIRTH MARRIAGE AND DEATH RATES (PER 1,000 POPULATION) 1938-1954



MARRIAGES

There were 15,831 marriages registered during the year 1954, this figure being 550 below the average for the ten year period 1944-53. The marriage rate, at 5.4 per 1,000 population in 1954, remained unaltered since 1948 having declined from 5.9 per 1,000 in the years 1945 and 1946. Although below the level attained during the period 1942-46, the marriage rate in the years 1948 to 1954 was appreciably higher than that of pre-war years. By reference to Table 5, page 6 it will be seen that the average marriage rate for the ten years 1931-40 was 4.9 per thousand and, for the ten years 1921-30 4.8 per thousand.

In Table I is shown the number of marriages per 1,000 population since 1938 in Ireland, the Six Counties, England and Wales and Scotland.

* Exclusive of the Six Counties

The marriage rate in this country is lower than that in the Six Counties, which is, in turn, low by comparison with the rates for England and Wales and Scotland. In these countries the marriage rate also reached a peak in the war years and subsequently tended to decline. As in the case of this country, the marriage rate tended to stabilise in the Six Counties and in Scotland in the years 1948 to 1954 while the England and Wales rate still tended to decline.

Mode of Celebration

The number of marriages celebrated in accordance with the rites and ceremonies of the Catholic Church registered during 1954 amounted to 15,000 (equal to 94.8 per cent of the total), and other marriages numbered 831. In the year 1954 the number of marriages, other than Catholic, recorded include 582 according to the rites and ceremonies of the Protestant Episcopalian Church, 121 in Presbyterian Meeting Houses, 41 in registered buildings belonging to various other religious denominations, 64 by civil contract in the Registrars' Offices and 21 according to Jewish rites.

At the Census of 1946 Catholics represented 94.3 per cent of the population, Protestant Episcopalians 4.2 per cent, Presbyterians 0.8 per cent, Methodists 0.3 per cent and Other Denominations 0.4 per cent.

The number of Catholic marriages recorded during 1954 corresponds to a rate of 5.42 per 1,000 of the estimated Catholic population, a rate which is 0.15 below the average rate for the preceding ten years. The rate for all other marriages in 1954 was 4.95 per 1,000 of all persons other than Catholics in the population or 0.02 above the average for the preceding ten years.

Corresponding rates for each year from 1944 to 1953 are shown in Table II.

Marriage Rates by Counties and Provinces

The marriage rates in the counties and county boroughs are shown in Table 14. In making comparisons of these marriage rates it must be remembered that the rates are based on the total number of marriages recorded in each area, irrespective of the fact that the persons married may not be residents of the area in which the marriage took place. An examination of the returns of marriages shows that many persons living in the rural portions of the country are married in the county boroughs or other urban areas. This fact accounts in some measure for the high rates for the county boroughs. In 1954 these were, Dublin County Borough 8.63 per 1,000 population, Cork County Borough 10.23, Limerick County Borough 7.73, Waterford County Borough 6.27. The lowest rates were recorded in Mayo County 3.35 per 1,000 population), Dublin County excluding Dun Laoghaire (3.59 per 1,000 population) and Limerick County (3.60 per 1,000 population).

Age at Marriage

The schedules to the Acts relating to marriage indicate that the law does not require that the ages of the contracting parties should be entered in the register or certificate. It is necessary only that each party should be described as of full age or minor, as the case may be, with the result that a complete record of the ages of the persons married is not available.

Particulars of marriages of minors (i.e. persons under 21 years of age) for 1954 and for a number of previous years are given in Table III.

TABLE III

MARRIAGES OF MINORS, 1938 AND 1944-1955

1954	294	1,277	1.86	8.07	434

In 1954 eight per cent of the females and less than two per cent of the males married were under 21 years of age. The percentages for 1954 are above the corresponding average for the ten year period 1944-53.

BIRTHS

The total number of births per annum, which averaged 60,400 in the period 1921-30, and 57,100 in the period 1931-40, showed a considerable increase from about 1942, and reached a maximum in the year 1947, during which 69,000 births were registered. The sudden rise in the number of births registered in 1942 was to some extent accounted for by the introduction of rationing, which had the effect of reducing the time-lag between birth and registration. The birth rate for 1942 must, therefore, be considered as somewhat overstated, mainly at the expense of 1943. Since 1947 the annual total of births has tended to decline, and in 1954 the number registered was 62,500. This downward trend, particularly since the year 1949, has however, been very slight, and it would appear that the number of births per annum is tending to stabilise at a level considerably above that of pre-war. Since the population in recent years has been fairly stable, these observations apply also to the birth rate (i.e. number of births per 1,000 population) which was 21.3 in 1954 compared with 21.2 in 1953, 23.2 in 1947 and 19.3 in the ten year period 1931-40.

In Table IV the birth rates in Ireland, the Six Counties, England and Wales and Scotland are compared for the years 1938-54.

The number of Catholic marriages recorded during 1954 corresponds to a rate of 5.42 per 1,000 of the estimated Catholic population, a rate which is 0.15 below the average rate for the preceding ten years. The rate for all other marriages in 1954 was 4.95 per 1,000 of all persons other than Catholics in the population or 0.02 above the average for the preceding ten years.

Corresponding rates for each year from 1944 to 1953 are shown in Table II.

1954	294	1,277	1.86	8.07	434

In 1954 eight per cent of the females and less than two per cent of the males married were under 21 years of age. The percentages for 1954 are above the corresponding average for the ten year period 1944-53.

BIRTHS

The total number of births per annum, which averaged 60,400 in the period 1921-30, and 57,100 in the period 1931-40, showed a considerable increase from about 1942, and reached a maximum in the year 1947, during which 69,000 births were registered. The sudden rise in the number of births registered in 1942 was to some extent accounted for by the introduction of rationing, which had the effect of reducing the time-lag between birth and registration. The birth rate for 1942 must, therefore, be considered as somewhat overstated, mainly at the expense of 1943. Since 1947 the annual total of births has tended to decline, and in 1954 the number registered was 62,500. This downward trend, particularly since the year 1949, has however, been very slight, and it would appear that the number of births per annum is tending to stabilise at a level considerably above that of pre-war. Since the population in recent years has been fairly stable, these observations apply also to the birth rate (i.e. number of births per 1,000 population) which was 21.3 in 1954 compared with 21.2 in 1953, 23.2 in 1947 and 19.3 in the ten year period 1931-40.

In Table IV the birth rates in Ireland, the Six Counties, England and Wales and Scotland are compared for the years 1938-54.

* Exclusive of the Six Counties.

The birth rate in this country is about the same as that in the Six Counties, but is considerably higher than the rates in England and Wales and Scotland. The war-time increase in the birth rate experienced in this country also occurred in the Six Counties, England and Wales and Scotland, although in the more recent years the increase, compared with pre-war, in these countries has not been sustained to the same extent.

Birth Rate by Area

Table V shows the crude birth rates (i.e. total births per 1,000 population) in the provinces and in the aggregate urban and aggregate rural districts, in 1938, and for each year since 1947.

The interesting feature of this table is the tendency towards uniformity in the provincial and in the urban and rural rates. In 1938 the difference between the highest birth rate (23.8 per 1,000 population in Dublin County and County Borough) and the lowest rate (17.3 per 1,000 population in Ulster (part of)) was 6.5; in 1954, however, the corresponding difference was only 3.6. In 1954 the birth rate in Dublin County and County Borough was 1.6 per 1,000 below that in 1938 and the rates in the rest of Leinster and in the other provinces were higher than in 1938. The large increase in the birth rate during the war was practically confined to that part of the country outside Dublin County and County Borough. In 1954 the difference between the urban and rural rate was only 0.6 compared with 4.9 in 1938.

The crude birth rates for the counties and county boroughs in 1954 are shown in Table VI. They range from 16.0 per 1,000 population in Leitrim to 27.5 in Limerick County Borough.

The crude birth rate is higher in Leinster and Munster than it is in the counties of the west and north west. On account, however, of the large volume of migration of young women to the larger towns the total births per 1,000 women aged 15-44 is lower in the county boroughs of Dublin and Cork than in the counties of Connacht and Ulster. Birth rates depend on the proportions of women at the reproductive ages, their age distribution and the proportion married, as well as on the fertility of married women. In Table VI the crude and standardised fertility rates of married women are shown. Standardisation eliminates the effect of variation in the fertility rates on account of different age distributions of the married women in the local areas. It will be seen that the standardised fertility rates give a very different picture of the fertility in different areas to that which would be derived from the crude rates alone. The standardised rate (number of births per 1,000 married women) is highest in the counties of Galway, Tipperary N.R. and Kerry and lowest in Dublin County, Cork County Borough and Wicklow County. Dublin, Waterford and Limerick County Boroughs occupy an intermediate position.

* The standardisation was indirect. Figures for the number of births per married women in each quinquennial age group from 15 years to 45 years were found from data relating to births in Dublin County Borough in 1941-45. For any particular county this fixed set of fertility rates was multiplied by the number of married women in the county in the corresponding age groups in 1951. The sum of the resulting products (the "expected" births) was divided by the number of married women aged 15-44 to derive an "expected" fertility rate. This "expected" rate was divided into the expected rate for Ireland calculated in a similar way to obtain a standardising ratio. By multiplying the crude fertility rate for any particular county by its corresponding standardising ratio the standardised fertility rate was obtained.

Illegitimate Births

There were 1,310 illegitimate births registered in 1954. This represents a proportion of 2.1 per cent of all births registered. The proportion of illegitimate births which averaged 3.3 per cent in the period 1931-40 rose to 3.9 per cent in the years 1944-46. Between 1946 and 1953 there was a decline each year in this proportion. The percentage of illegitimate births in each of the provinces is shown in Table VII.

TABLE VII

1954	2.1	1.7	2.7	2.1	1.3	3.1

The highest percentages occur in Ulster and in Leinster (excluding Dublin County and County Borough) while the lowest percentage occurs in Connacht. The highest percentages in 1954 were in the following counties: Limerick (excluding the Co. Borough) (4.1), Laoighis (3.8), Donegal (3.7) and Waterford (3.7).

Proportion of Males to Females

The number of male births registered in 1954 was 32,087 and the number of female births was 30,447. The sex ratio was 1,052 males per 1,000 females compared with 1,064 in 1953. The sex ratio for each year since 1944 is shown in Table VIII and legitimate and illegitimate births are distinguished.

TABLE VIII

NUMBER OF MALE BIRTHS PER 1,000 FEMALE BIRTHS, 1944 TO 1954

Year	Legitimate	Illegitimate	Total
1944	1,059	1,028	1,058
1945	1,057	1,014	1,056
1946	1,070	1,092	1,071
1947	1,071	1,089	1,071
1948	1,064	1,076	1,064
1949	1,050	1,101	1,051
1950	1,074	965	1,071
1951	1,055	1,103	1,057
1952	1,046	1,016	1,045
1953	1,064	1,040	1,063
Average 1944-53	1,061	1,052	1,061
1954	1,052	1,120	1,054

Since 1944 the sex ratio for all births has varied between 1,045 and 1,071. As is to be expected on account of the smaller numbers of illegitimate births the variation is wider for these than for the legitimate births, the lowest figure being 965 and the highest 1,120.

Multiple Births

The number of infants born alive in multiple births registered during 1954 was 1,768, consisting of 875 pairs of twins and 6 sets of triplets, as compared with 1,731 (843 pairs of twins and 15 sets of triplets) for the previous year. The numbers of children born in multiple births, as a percentage of total births, for each year since 1944 are shown in Table IX, distinguishing legitimate and illegitimate births.

TABLE IX

CHILDREN BORN IN MULTIPLE BIRTHS AS A PERCENTAGE OF TOTAL BIRTHS, 1944 TO 1954

Year	Legitimate Births	Illegitimate Births
1944	2.7	2.6
1945	2.8	1.6
1946	2.3	1.7
1947	2.8	2.3
1948	2.6	2.0
1949	2.9	1.5
1950	2.8	2.5
1951	2.9	1.9
1952	3.1	2.2
1953	2.8	1.9
Average 1944-53	2.8	2.0
1954	2.8	1.8

The percentage of multiple births was higher for legitimate births than for illegitimate births in each year of the period 1944-54.

Late Registrations

As stated on Page vi, the figures for numbers of births exclude late registrations, i.e. births registered more than one year after occurrence. A considerable number of such births is registered every year. The number in 1954 was 1,290. The inclusion of these births would change the birth rate for 1954 from 21.3 to 21.8 per 1,000 population.

DEATHS

The number of deaths registered during the year 1954 was 35,535, the males numbering 19,199 and the females 16,336. The total is 944 more than the number for 1953, and 4,230 less than the average for the decennial period 1944-53.

The death rate in 1954 which was 12.1 per thousand population was 0.4 above that for 1953. The average rate for the period 1944-53 was 13.4 per thousand population.

In Table X are shown the average annual death rates, by age groups, for decennial periods since the beginning of this century, and for single years from 1946 to 1954.

It will be seen that striking falls have occurred in the death rates at the younger ages since the early years of the century, and that the rate of improvement has been greatest in the most recent years. The death rate in the group under 5 years declined by over 70 per cent from the period 1901-10 to 1954. In the groups from 5 to 24 years the decline from 1901-10 to 1954 is over 80 per cent and in the age group 25-34 years this decline is 80 per cent. At ages over 65 years changes in the death rates since 1901-10 have been relatively slight.

Table XI shows the number of deaths in the country for each year since 1938 and compares the annual death rate with those in the Six Counties, England and Wales and Scotland.

* Exclusive of the Six Counties

With the exception of the years 1938, 1940 1941 and 1952 the death rate in this country is the highest in the table over the whole period.

The decrease in the death rate since 1947 resulted in a large improvement in the expectation of life at birth in 1951, compared with earlier periods. The 1951 official life tables have not been issued at the time of writing and for comparative purposes the expectations of life at birth in 1951 have been compiled by an abridged method of computation. These rates compare with corresponding rates in 1941 and 1946 as follows:-

Expectations of life at birth

Year	Males	Females
1941	59.0	61.0
1946	60.5	62.4
1951	63.7	66.6

Between 1946 and 1951 the male expectation increased by 3.2 years compared with 1.5 years in the preceding 5 years. The increase for females was 4.2 years compared with 1.4 years in the earlier period.

Rates by Counties

In Tables 14 and 16 death rates are given for each of the provinces, counties, county boroughs, principal towns and aggregate urban and aggregate rural districts. Care must be taken in drawing inferences from the differences in death rates in the different areas of the country. Since the rates of mortality are higher in the older sections of any population it is obvious that the crude death rate for all ages in a population may be affected markedly by the age distribution of the population. If the proportion of elderly persons is higher in a particular section of the population than it is in the general population, then the death rate in this section will be higher than it is in the general population, even though health conditions are the same in this section of the population. In order to compare death rates by areas it is necessary, therefore, to standardise the death rates for age. For a particular county this is done by calculating the death rate in each age group of the population in that county, then multiplying the death rate in each age group by the total population in the whole country in that age group, and summing the resulting products. This sum is then divided by the total population in the country at all ages, to deduce the standardised rate for the county. Differences arising from variations in the age distributions of the population in the counties are thereby eliminated. Table XII shows the crude and standardised rates for each county and county borough for 1954.

In certain areas the standardised rates are quite different from the crude rates. Leinster, which had the lowest crude death rate in 1954, had, with Munster, the highest standardised rate among the provinces. Connacht, which had the highest crude rate, had the lowest standardised rate. Standardisation raised the rates in the county boroughs, the Borough of Dun Laoghaire and in counties Carlow, Dublin, Kildare, Louth, Meath, Offaly and Wicklow, and lowered them everywhere else. The crude rate varied from 9.4 per 1,000 population in Dublin County (excluding Dun Laoghaire Borough) to 15.2 in Cavan. The standardised rates were more uniform, the range of variation having been from 10.2 in Mayo to 14.3 in Limerick County Borough.

For valid comparisons between the death rates in different counties and county boroughs, it is, of course, the standardised rates which should be used. These show that, in general, having allowed for differences in age constitution of the population, death rates were lowest in the counties of Mayo, Galway, Kerry, Clare, Roscommon and Donegal. They were highest in Limerick County Borough, Carlow, Cork County Borough, Cavan, Tipperary S.R. Dublin County excluding Dun Laoghaire and Tipperary N.R.

Causes of Death

The tables in this Report showing cause of death are based on the Sixth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death, 1948, prepared by the World Health

Organisation. The Sixth Revision was used for the first time in classifying deaths by cause in the 1950 Report. From 1940 to 1949 the Fifth Revision was used.

In Table 19 which shows causes of death, by age for the whole country, the classification of cause of death used is the Detailed International List. The deaths classified according to this Detailed List are shown for each year from 1951 to 1954 in an Appendix. The Abbreviated International List is used to classify deaths in Table 20. Certain causes in the Abbreviated List are, however, subdivided and these are shown by small letters placed after the abbreviated list number. For example B40 is divided into B40a (complications of pregnancy and childbirth), B40b (puerperal sepsis) and B40c (other complications of the puerperium). In Tables 21 and 23 a special list of 47 causes is used and the relationship between this list and the Detailed International List is shown at the beginning of Table 21. In Table 22 a short list of 11 causes is used and the relationship between this list and the International List is shown at the beginning of the Table. For infant mortality a special list of causes has been adopted and these are used in Tables 24 to 27.

Table XIII shows the numbers of deaths and death rates from some of the principal causes in 1935-37, 1945-47 and for each year since 1949.

For comparability, the classification used in this table is based on the Sixth Revision of the International Statistical Classification of Diseases, Injuries and Causes of Death, 1948, and, therefore, the numbers of deaths and death rates from certain causes for years prior to 1950 do not agree with the figures published in the annual reports for those years.

Compared with earlier years the figures for 1954 show marked declines in the numbers of deaths from tuberculosis, diphtheria and other infective and parasitic diseases. In 1954 there were 1,005 deaths from tuberculosis, compared with 1,187 in 1953 and annual averages of 3,594 in 1945-47 and 3,629 in 1935-37. There were 5 deaths from diphtheria, compared with 3 in 1953 and annual averages of 144 in 1945-47 and 339 in 1935-37. The death rate from all forms of tuberculosis, which was 122.2 per 100,000 population in 1935-37, was only 34.3 in 1954.

Over the period shown in the table the death rates from cancer, vascular lesions affecting the central nervous system, diseases of the heart and other diseases of the circulatory system, have shown an upward tendency. In 1954 there were 4,423 deaths from cancer compared with 4,333 in 1953 and an annual average of 3,601 for the years 1935-37. Deaths from vascular lesions affecting the central nervous system numbered 3,488 in 1954, 3,266 in 1953 and an average of 2,350 per year in the period 1935-37. There were 10,630 deaths from diseases of the heart in 1954 compared with 9,648 in 1953 and 7,509 average per year in 1935-37.

The death rate from influenza was lower in 1954 than in 1953, but shows no definite trend over the period considered. On account of a severe influenza epidemic which occurred in 1951, the 1951 figure is higher than that for any single year since 1937. There were decreases in the death rates from senility and "other diseases" between 1951 and 1954 but the 1951 figures are considerably lower than those of 1935-37, for which period the average death rate from all causes was much the same as in 1951. It is probable that a considerable part of the decline in the number of deaths ascribed to senility is due to the improvement in certification; uncertified deaths represented only 9.2 per cent of the total in 1954 compared with an average of 17.6 per cent for the years 1935-37. Uncertified deaths are discussed more fully in a later section. There was no appreciable variation in the death rate from accidents and other external causes over the whole period considered.

The proportions of deaths in 1954 from the principal causes in certain age groups and the total number of deaths in each age group are shown in Table XIV.

It will be observed that diseases of the heart caused the largest proportions of deaths, namely 299 in each 1,000 deaths. The next in order are malignant neoplasms (129), vascular lesions affecting central nervous system (98) and senility (97). At ages under 1 year congenital malformations and diseases of early infancy accounted for 670 out of every 1,000 deaths, while pneumonia caused a further 122 deaths and 64 were due to diarrhoea and enteritis. At ages 1-4 years pneumonia caused 154 per 1,000 deaths, accidents, poisoning and violence accounted for 138 and tuberculosis 111. The proportion of deaths caused by tuberculosis increased considerably in the early adult age groups. At ages 5-14 years 136 out of every 1,000 deaths were caused by this disease. At ages 15-24 the proportion was 200 per 1,000 deaths, and at ages 25-34 it was 234 per 1,000 deaths. At ages 35-44 years tuberculosis was still an important cause of death, the proportion of deaths from it being 146 per 1,000 but in this age group both malignant neoplasms and diseases of the heart accounted for greater proportions of the total number of deaths. Between ages 45 and 75 years the chief causes of death were diseases of

the heart, vascular lesions affecting the central nervous system and malignant neoplasms.

At ages over 75 years diseases of the heart accounted for about one-third of the deaths at these ages, and senility accounted for a further one-quarter. Almost seven per cent of the deaths which occurred in 1954 were of infants under 1 year and sixty-six per cent were of persons 65 years and over. Deaths of persons between the ages of 1 year and 44 years

accounted for eight per cent of the total. Some of the principal causes of death are considered in greater detail in the following paragraphs.

Tuberculosis

Table XV shows the number of deaths, and the death rate per 1,000 population, from tuberculosis for each year since 1938.

1954	797	0.27	208	0.07	1.59	0.93

In 1954 there were 1,005 deaths from tuberculosis, of which 797 were caused by the respiratory form and 208 by other forms of the disease. There has been a marked reduction in the number of deaths, both from tuberculosis of the respiratory system and from other forms, in a comparatively recent period and the number of deaths from this cause in 1954 was the lowest recorded, being less than a third of the number in 1948. The number of male deaths, both from respiratory and other forms of tuberculosis is, in general, somewhat higher than the number of female deaths, and the ratio of male to female deaths, particularly in respect of tuberculosis of the respiratory system has shown a tendency to rise. The death rate from tuberculosis of all forms, which was 1.09 per 1,000 population in 1938, increased, during the war years, to 1.47 in 1942 since when, with the exception of the year 1947, there has been a downward trend. The rates in this country, the Six Counties, England and Wales and Scotland for the years 1938-54 are compared in Table XVI.

* Exclusive of the Six Counties.

The striking feature in this table is the extent to which Ireland, where the death rate from tuberculosis has been higher than in the other countries, has continued to share in the general reduction in mortality rates. In 1954 the Six Counties mortality rate was the same as that for England and Wales which previously had been consistently lower.

In Table XVII tuberculosis death rates are examined by age groups, for a number of different periods.

There was little change, either in the over-all death rate or in the rates for individual age groups, between the periods 1935-37 and 1945-47. However a notable change in the distribution of tuberculosis deaths between the age groups became evident in the most recent years consequent upon the considerable reduction in the death rates in all age groups. Whereas, in 1935-37 and 1945-47 the tuberculosis death rate was highest among men between the ages of 20 and 34 years, in 1953 the 1954 the rate was highest among men 45 years and over. In the case of females the death rate from tuberculosis between the ages of 15 and 44 years was very high in the periods 1935-37 and 1945-47, and the striking improvement in recent years is mainly among persons in this age group. The mortality rate for children under 15 years due to tuberculosis in 1954 was only quarter of that in the period 1945-47.

Table XVIII compares the average annual death rates in different age groups from all forms of tuberculosis in Ireland and neighbouring countries for the period 1952-54. Since the age distribution of the population in these countries is somewhat different from that in Ireland and since the tuberculosis death rate varies considerably with age, the last line of this table shows the standardised death rates, i.e. an estimate of what the death rates would have been if the age distributions were in all cases the same as that in Ireland.

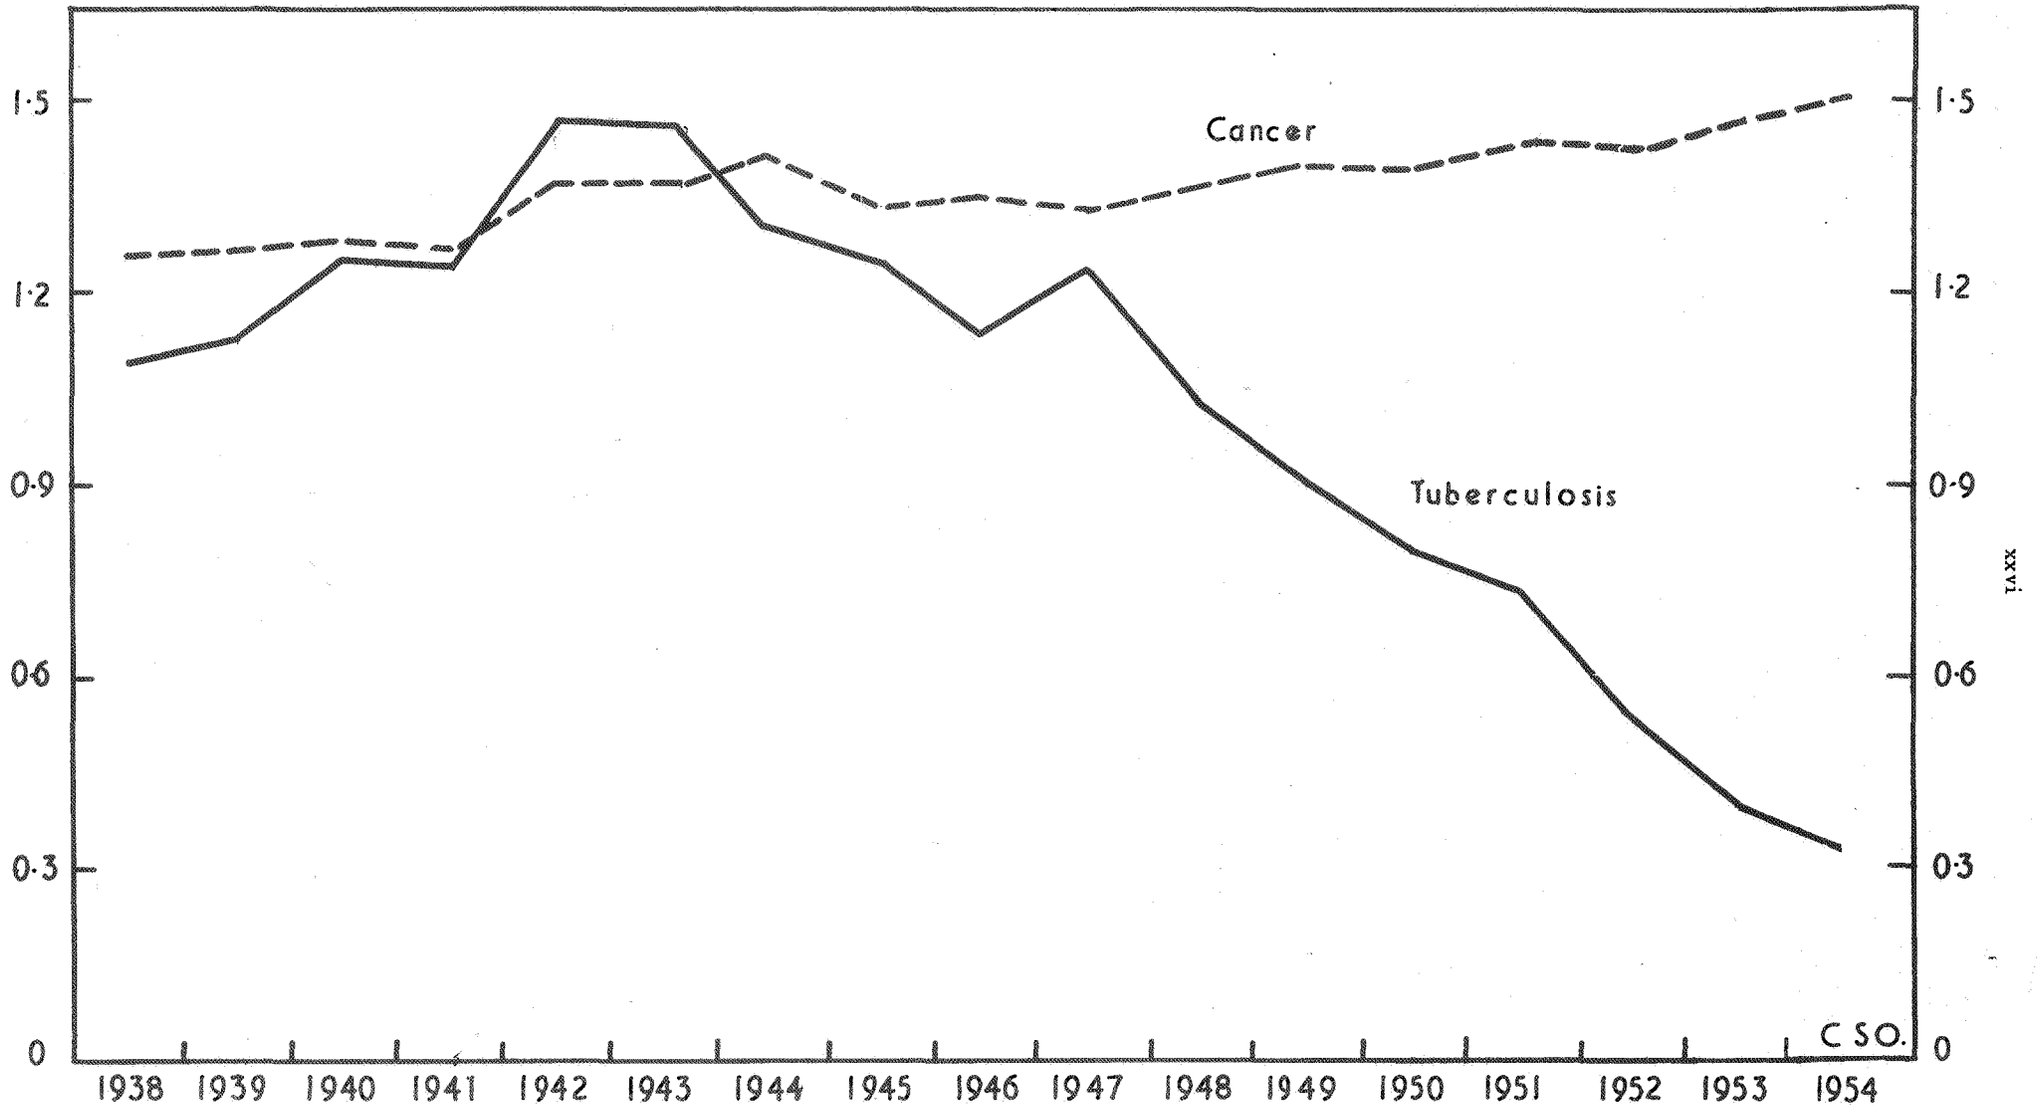
/ Standardised to the 1951 Census of population of Ireland.

The effect of standardisation is to reduce still more, by comparison with this country, the death rate in England and Wales and to a lesser extent that in Scotland and the Six Counties. The difference between the tuberculosis death rates in England and Ireland was most marked in 1952-54 in the case of children and young adults, the England and Wales rate being less than a quarter of that in Ireland. Among persons 55 years and over the England and Wales rate was two-thirds of that in Ireland.

The death rate from tuberculosis (all forms) over the period 1938-54 is illustrated in Diagram 3. Also shown in this diagram is the death rate from cancer, discussed in the next section.

Diagram 3

DEATH RATES (PER 1,000 POPULATION) FROM TUBERCULOSIS AND CANCER 1938-1954



Cancer

Up to 1949 cancer deaths were those classified as Nos. 045-055 of the Fifth Revision of the International List of Causes of Death. Since 1950 deaths have been classified according to the Sixth Revision of the International List. It has been recommended by the World Health Organisation that total cancer deaths should be based upon Nos. 140-205 of the International Statistical Classification, 1948, but that for comparability with the past, Nos. 140-205 (excluding Nos. 201 (Hodgkin's disease) and 204 (leukaemia and aleukaemia)) should also be shown.

In 1954 there were 4,594 deaths from malignant neoplasms (Nos. 140-205). Of this number 45 deaths were caused by Hodgkin's disease and 126 by leukaemia and aleukaemia.

Table XIX shows the death rate from cancer (excluding Hodgkin's disease and leukaemia and aleukaemia) in Ireland and neighbouring countries since 1938.

* Exclusive of the Six Counties.

The general increase in the cancer death rate in each area since 1938 will be noted. The rate in Ireland (exclusive of the Six Counties) is the lowest (except for 1954 when the rate in the Six Counties was lowest) but this fact can be attributed, to some extent at least, to the high proportion of uncertified deaths at the older ages in this country. Most of these deaths are described as due to senility but it is probable that some of them are caused by cancer. The figures should be accepted with caution, as it is not certain to what extent they are comparable over the period shown and between the different countries.

Table XX shows the death rate from cancer in certain age groups for each year since 1938.

The most notable feature of this table is the large increase in the death rate at ages 75 years and over since 1938. It is almost certain that this increase is connected with the fall in the number of uncertified deaths (most of which occur at the old ages) from 16.0 per cent in 1938 to 9.2 per cent in 1954, and to improved certification. It is noteworthy also that the death rates from cancer, in the age groups 45-54 and 55-64 years, have shown no tendancy to rise, since 1938.

There were 2,458 deaths of males and 2,136 deaths of females from malignant neoplasms in 1954. Excluding Hodgkin's disease, leukaemia and aleukaemia, the figures were 2,362 males and 2,061 females. These latter figures are comparable with deaths from cancer prior to 1950. The number of deaths assigned to malignant neoplasms of the digestive organs and peritoneum is about half the total of those due to malignant disease of all sites. A gradual increase has occurred in the number of deaths ascribed to malignant disease of the respiratory system in recent years, the rates for the sexes differing considerably. In 1954 the mortality rate of males was more than three times that for females.

It will be observed from the Table that there is in general a rapid rise in the death rate with increasing age. An exception is cancer of the respiratory system of males, in which group the death rate at 75 years and over is lower than in the preceding age group. The death rate from neoplasms of lymphatic and haematopoietic tissues also decreases at the very old ages for both sexes.

Table XXII shows the death rates from malignant neoplasms in certain age groups for each county and county borough in 1954. Standardised rates which eliminate the effect of different age distributions of the population are shown in the last column.

For the whole country, the rate increased with age from 0.18 per 1,000 population at ages under 45 years to 10.47 at ages 75 years and over. The crude rate for all ages varied from 1.20 per 1,000 population in Wicklow to 1.95 in Cavan. In certain counties however, the standardised rates were considerably different from the crude rates, and when comparing the relative seriousness of mortality in different counties it is, of course, the standardised rates which should be used. In the counties of the west and north west, standardisation lowered the death rates considerably. The standardised rates varied from 1.13 per 1,000 population in Leitrim to 2.03 in Cork County Borough. The low rates in Connacht and Ulster (part of) can, to some extent, be attributed to the registration of large numbers of uncertified deaths in these counties, most of which are returned as being due to senility or some undefined cause. If these deaths had been medically certified it is probable that a number would have been certified as being due to malignant neoplasms.

Cancer of the Lung

The increase in cancer of the lung as a cause of death when the position in 1954 is compared with that in earlier years is a matter which compels attention.

It is true that, with improving expectation of life, more people now are living to ages at which cancer commonly occurs than was the case formerly. It is true also that the numbers of deaths registered as uncertified have more or less steadily decreased, and that, since most of these occur at older ages, this improvement must almost certainly have uncovered deaths from cancer which would not have been so designated in earlier years. Finally, in the 29-year interval since 1925 diagnostic techniques have greatly improved, so that more cases would be diagnosed in 1954 than would have been possible in 1925. But while all these factors may be held to account in some measure for the recorded increase in the cancer death rate as a whole, the fact remains that, as compared with cancer in other sites, cancer of the lung has shown a startling increase.

Table XXIII shows the numbers of deaths recorded from cancer of the bronchus, lung, trachea, larynx and mediastinum (referred to as "cancer of the lung") at each 5-year interval since 1925 and the death rates per 100,000 population at each period in Ireland, the Six Counties, Scotland and England and Wales.

In 1925, the death rate in Ireland from cancer of the lung was 1.9 per 100,000 population; at subsequent 5-year intervals this rate showed a continuing increase which brought it to 5.3 in 1940. In 1945 it was 7.0, in 1950 it had risen to 10.0, and by 1954 had reached 17.2. This figure of 17.2 in 1954 represents an increase of more than 800 per cent over the 1925 rate. Although very large increases occurred also in the other countries shown, they were not quite of this high order - in the Six Counties the increase from 1925 to 1954 was something less than 600 per cent, in Scotland just over 500 per cent, and in England and Wales about 560 per cent.

Table XXIV shows the figures relating to Ireland in greater detail, with numbers and rates distributed between males and females and allotted to the various age-groups.

The first point that emerges from the table is that deaths from the disease have always been more common among males than among females, but that over the period from 1925 to 1954 the disparity has gradually increased so that in the latter year the number of deaths of males was almost three times as great as the number of deaths of females. The increase in the rate of male deaths has also been much more severe than in females - from a frequency of 2.5 per 100,000 population in 1925, the figure for males rose to 25.2 in 1954, a tenfold increase; the corresponding figures for females were 1.2 and 8.9 - something more than a sevenfold increase.

The age-groups most heavily affected by the rising death rate differ somewhat in the two sexes. For males, apart from the youngest age-group shown, the increase in death rate is more or less marked in every age-group; over the 29-year period the increase at all ages over 45 has been about tenfold - somewhat irregularly reached in the age-group 45-54 years but steadily in the age-group 55-64 years and almost uniformly also at ages 65 years and over. The largest increase for males in any five-year period appears in the age-group 65 years and over, where the rate more than doubled between 1940 and 1945; the death rate in this age-group again increased by practically 100 per

For the whole country, the rate increased with age from 0.18 per 1,000 population at ages under 45 years to 10.47 at ages 75 years and over. cent between 1950 and 1954. In the case of females, the death rate increased irregularly in the 45-54 years age-group, probably on account of the relatively small number of deaths at ages under 55 years; in the age-group 55-64 years, the increase in death rate was consistent throughout the whole period and the rate doubled itself in the interval 1950-54.

Heart Diseases

As already observed from Table XIV, diseases of the heart caused 299 in every 1,000 deaths in 1954. There were 10,630 deaths from diseases of the heart (Nos.410-434 of the International List). Of these, 2,931 deaths were caused by arteriosclerotic heart disease, including coronary disease, 592 were caused by chronic endocarditis not specified as rheumatic, and 5,330 by other myocardial degeneration. There were 404 deaths from chronic rheumatic heart disease and 1,373 deaths from other diseases of the the heart.

Respiratory Diseases

Deaths from respiratory diseases (Nos.470-527 on the International List) in 1954 numbered 2,542. These include 174 deaths caused by influenza, 1,045 by pneumonia, 1,002 by bronchitis and 321 by other respiratory diseases.

Pregnancy, Childbirth and the Puerperium

The number of deaths in this group of causes in 1954 was 69, compared with 83 in 1953 and 92 in 1952. The death rate was 1.10 per 1,000 births, the lowest recorded.

Table XXV shows the deaths in 1954 classified by cause and age of mother.

Infant Mortality

During the year 1954 the deaths of 2,364 infants under 1 year of age were registered, compared with 2,463 in 1953 and 2,674 in 1952. The figure for 1954 is equivalent to a rate of 37.8 per 1,000 live births registered, this being the lowest recorded and compares with 39.4 in 1953 and 41.4 in 1952. A considerable reduction in infant mortality has taken place in recent years: the average annual rate for the ten year period 1941-50 was 65.8 and for the period 1931-40, 68.4 deaths per 1,000 live births. In Table XXVI the infant mortality rates in Ireland and neighbouring countries are compared for recent years and for each decade since the beginning of the century.

Up to the year 1930 the infant mortality rate in Ireland maintained a lower level than that in the Six Counties, England and Wales or Scotland. In the decade 1931-40, also, the Irish rate compared very favourably with that in the Six Counties and Scotland although a marked reduction in infant mortality in England and Wales had now brought the rate for these countries below that for Ireland. In the decade 1941-50 and in each of the years 1951 to 1954 the Irish rate is the highest in the table.

In Table XXVII is shown the mortality rates (per 1,000 births) at different ages under one year and these rates expressed as percentages of the total infant mortality for the years 1938 and 1946 to 1954.

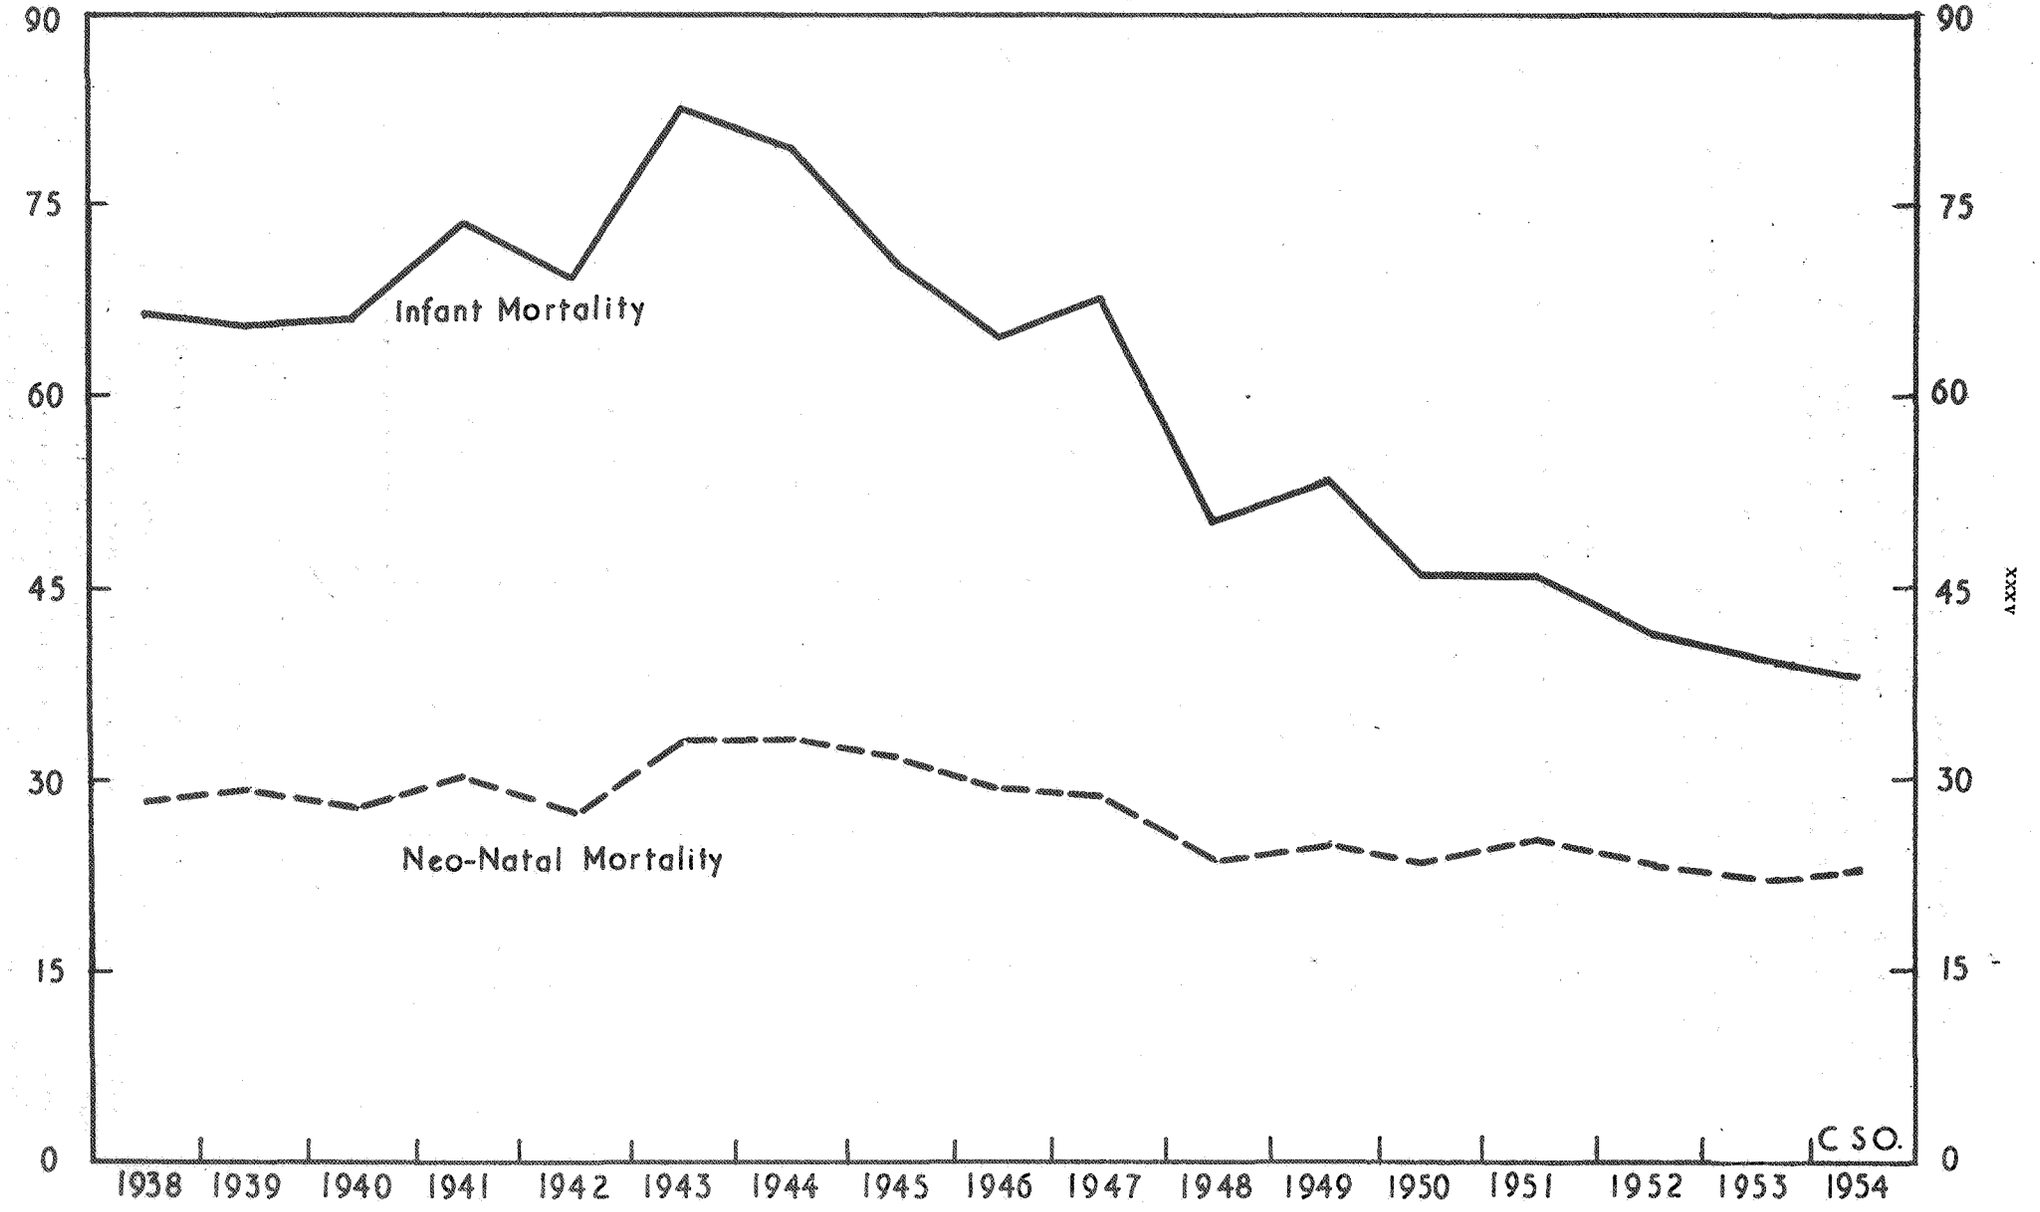
INFANT AND NEO-NATAL MORTALITY (PER 1,000 LIVE BIRTHS) 1938 — 1954



XXXX

It is noteworthy that, despite the considerable success in the reduction of infant mortality in recent years, death rates of newly born infants and infants under seven days old have shown no reduction. However, once the first week of life had been passed, infants born in 1954 had a considerably better chance of survival than those born in 1938 or 1946.

The neo-natal mortality (i.e. deaths of infants under 28 days per 1,000 live births) and the infant mortality for males and females for the years 1938 to 1954 are shown in Table XXVIII.

1952	25	21	45	37
1953	25	19	44	35
1954	26	19	43	32

The rates for females are, in general, only 75 to 85 per cent of the corresponding rates for males.

Table XXIX compares the neo-natal and infant mortality for counties and county boroughs for each of the years 1952-54. In general the areas with the highest infant mortality rates have also the highest rates of neo-natal mortality. In 1954 the infant mortality rates were highest in the cases of County Limerick, County Offaly, County Waterford, Limerick County Borough and Tipperary (S.R.). Cork County Borough had the lowest infant mortality rate in 1954. Other areas having relatively low infant mortality rates in 1954 are County Roscommon, Tipperary (N.R.) and County Mayo.

In Table XXX are shown the infant mortality rates in certain urban areas and in aggregate rural districts, for the years 1938, 1946 and 1952 to 1954.

TABLE XXX

INFANT MORTALITY IN URBAN AND RURAL DISTRICTS, 1938, 1946 AND 1952 TO 1954

Area	1938	1946	1952	1953	1954	Percentage decline 1938 to 1954
TOTAL	67	65	41	39	38	43
Dublin County Borough and Dun Laoghaire Borough	96	91	38	41	35	64
Other County Boroughs	76	65	49	42	37	51
Other towns with population over 10,000	69	70	47	42	48	30
Other Urban Districts	66	65	47	44	25	62
Rural Districts	56	56	41	38	38	32

In 1938 and 1946 considerable differences existed in the infant mortality rates between the different types of district. The rate was by far the highest, in these years, in the combined areas of Dublin County Borough and Dun Laoghaire Borough and was lowest in aggregate rural districts. Other county boroughs, towns with over 10,000 population and urban districts occupied an intermediate position. The relative improvement in recent years has been greatest in the case of Dublin and Dun Laoghaire and in 1954 the infant mortality rate for these districts fell below the level in Rural Districts. In the smaller Urban Districts the infant mortality rate in 1954 was very low.

In Table XXXI is shown the rate of infant mortality according to cause of death, and also the proportion of deaths due to each cause in the years 1938, 1946 and 1952 to 1954.

Congenital malformations comprised the largest single group of causes in 1954, accounting for 172 per 1,000 deaths of infants. The rate of infant mortality from this cause group, at 6.49 per 1,000 births registered, was somewhat higher than that for the years 1938, 1946 and 1952 but lower than that for 1953. The group "Other and ill-defined diseases peculiar to early infancy" accounted for 134 per 1,000 deaths of infants in 1954. Of this total of 134, 46 were with mention of immaturity, while 167 per 1,000 deaths in 1954 were ascribed directly to immaturity. Pneumonia caused 158 per 1,000 deaths of infants in 1954, having a corresponding mortality rate of 5.98 per 1,000 births. Birth injuries in 1954 accounted for a proportion of 71 per 1,000 deaths, a considerably higher proportion than in 1946 or 1938. The remaining major cause of death among infants, namely diarrhoea and enteritis, was responsible for 63 per 1,000 deaths in 1954, a much lower proportion than in 1946 or 1938.

Accidents, Poisonings and Violence

The number of deaths from external causes, in 1938 and in each of the years 1947 to 1954, is shown in Table XXXII.

TOTAL	957	971	922	979	905	996	862	907	970

The total number of deaths from accidents, poisonings and violence in 1954 was 970, compared with 907 in 1953 and 862 in 1952. This figure does not differ greatly from the total of 957 in 1938. Road vehicle accidents account for an increasing proportion of the total deaths each year.

Uncertified Deaths

The number of cases in 1954, in which the cause of death was not stated to have been certified by a medical practitioner, was 3,273 which was 9.2 per cent of the total of deaths registered. The proportion for 1953 was 9.8 and, for 1952, 10.6 per cent.

Table XXXIII shows the average percentage of deaths uncertified in each county and county borough for the periods 1935-37, 1945-47, 1951-53 and for the year 1954.

The proportion of deaths uncertified was again very high in 1954 in Connacht, the highest counties being Leitrim, Mayo and Roscommon. In the county boroughs, on the other hand, only a very small proportion of deaths were uncertified. There has been a considerable improvement with regard to certification since the period 1935-37. However, the position is still far from satisfactory and it is evident that the high percentage of deaths uncertified in some counties seriously detracts from the value of the cause of death statistics for these regions.

Inquests and Post-Mortems

The number of deaths registered on certificates issued by coroners, as the result of inquests and post-mortem examinations during 1954 was 1,553 compared with 1,517 in 1953 and 1,447 in 1952.
